

HEMATOLOGY

I- Blood picture

(Complete blood count)

By

Prof. Mahmoud Rushdi
Assiut University
Egypt

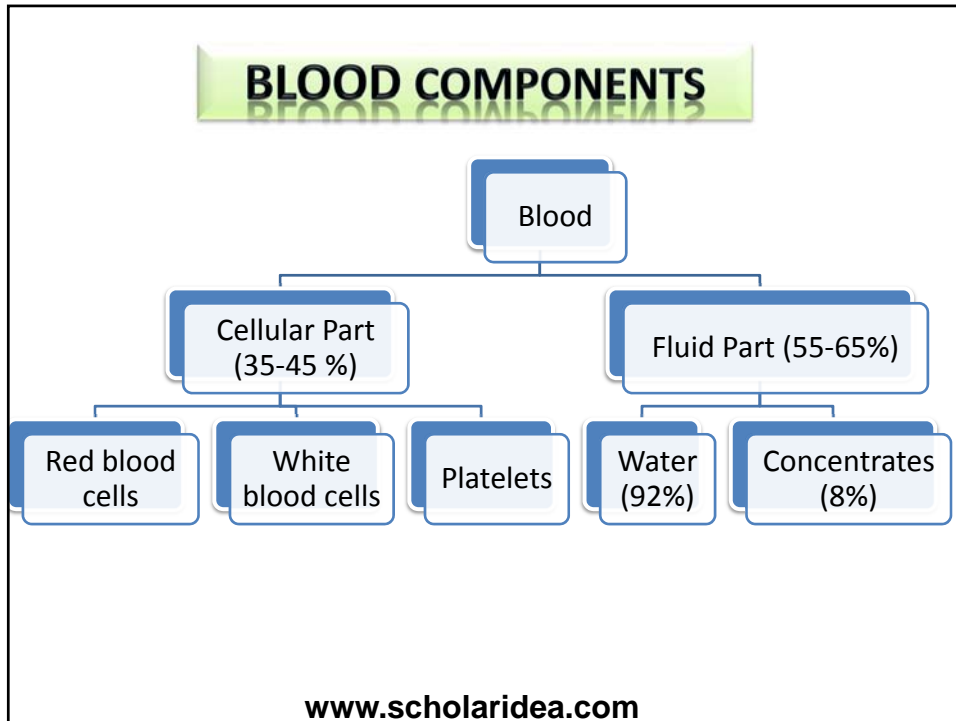

1

www.scholaridea.com

Hematology may be defined as the scientific study of the structure and function of the blood in health and disease. Hematology therefore is a laboratory science in which we quantitatively and qualitatively observe the different components of blood in order to diagnose a great variety of diseases.

Component	Your Value	Standard Range	Units	Flag
White Blood Cell Count	5.4	4.0 - 11.0	K/uL	
Red Blood Cell Count	5.20	4.40 - 6.00	M/uL	
Hemoglobin	16.0	13.5 - 18.0	g/dL	
Hematocrit	47.2	40.0 - 52.0	%	
MCV	91	80 - 100	fL	
MCH	30.8	27.0 - 33.0	pg	
MCHC	33.9	31.0 - 36.0	g/dL	
RDW	12.7	<16.4 -	%	
Platelet Count	149	150 - 400	K/uL	L
Differential Type	Automated			
Neutrophil %	56	49.0 - 74.0	%	
Lymphocyte %	23	26.0 - 46.0	%	L
Monocyte %	13	2.0 - 12.0	%	H
Eosinophil %	7	0.0 - 5.0	%	H
Basophil %	1	0.0 - 2.0	%	
Abs. Neutrophil	3.1	2.0 - 8.0	K/uL	
Abs. Lymphocyte	1.2	1.0 - 5.1	K/uL	
Abs. Monocyte	0.7	0.0 - 0.8	K/uL	
Abs. Eosinophil	0.4	0.0 - 0.5	K/uL	
Abs. Basophil	0.0	0.0 - 0.2	K/uL

Test description	Observed value	Unit	Reference range
<i>Erythrocytes</i>			
Total count	4.21	$\times 10^6/\mu\text{L}$	3.8–5.4
Hemoglobin	9.6	g/dL	10.5–14.0
PCV (hematocrit)	30.1	%	32–42
MCV	71.5	fL	72–88
MCH	22.8	pg	24–30
MCHC	31.9	g/dL	32–36
<i>Leucocytes</i>			
Total leucocyte count	11,700	%	4400–11,300
Neutrophils	31	%	45–74
Lymphocytes	66	%	22–50
Basophils	00	%	0–1
Eosinophils	02	%	0–4
Monocytes	01	%	1–8
<i>Platelets</i>			
Total count	840	$\times 10^3/\mu\text{L}$	10–400
MPV	7.7	fL	8–12
¹⁵ PDW	8.8	fL	9–14

Mechanism of stimulation of Red blood cells synthesis

14

www.scholaridea.com

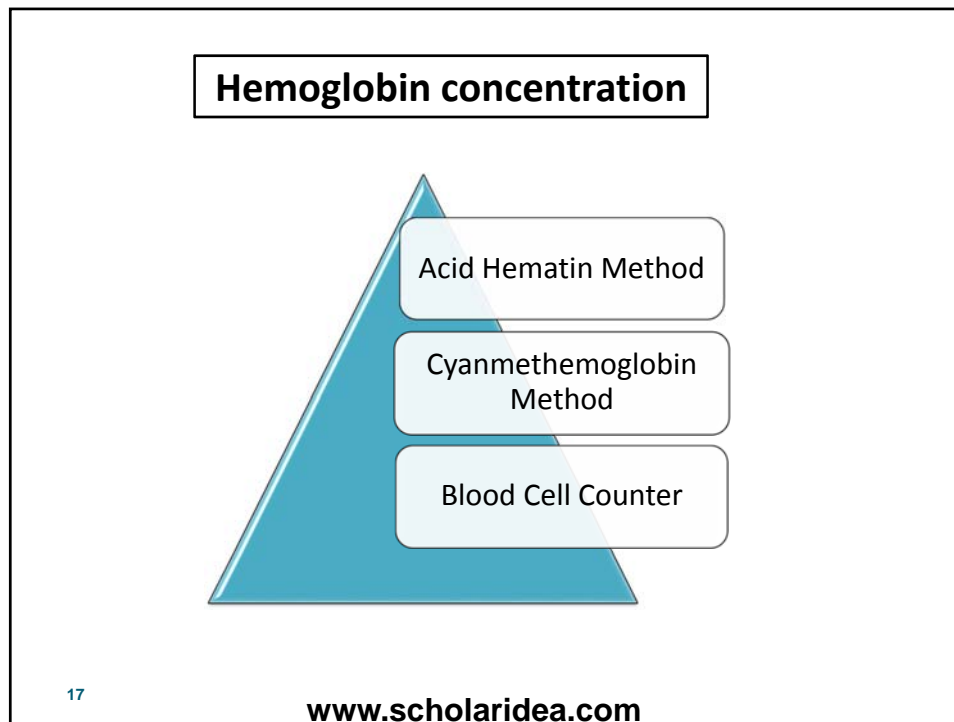

Physiological Factors affecting the RBCs count:

- **Exercise**
- **High altitude**
- **Excitement and Stress**
- **Age**
- **Sex**
- **High Environmental Temperature**
- **After Meals**
- **Pregnancy**

16

www.scholaridea.com

Hemoglobin concentration

Increase haemoglobin concentration

- ❖ Chronic carbon monoxide poisoning.
- ❖ Polycythemia.
- ❖ Cardiac diseases.
- ❖ Pulmonary diseases.

Decrease hemoglobin concentration

- ❖ Anemia.
- ❖ Amyloid nephrosis.
- ❖ Leukaemia.
- ❖ Malignant tumors.

18

www.scholaridea.com

Hematocrit Packed cell volume (PCV)

Packed cell volume (PCV) or Hematocrit, is defined as the percentage of blood occupied by RBCs, or simply you can define PCV as the percentage of RBCS in whole blood.

www.scholaridea.com

Packed cell volume (PCV)

21

Packed cell volume (PCV)

Advantages of the microhematocrit method:

- The amount of blood required is considerably less.
- Time required for the entire procedure is less.
- accurate.

Disadvantages of the microhematocrit method

- Special reader is required for reading.
- It is impossible to determine E.S.R. in such small tubes.
- It is difficult to evaluate the depth of the buffy coat.

22

www.scholaridea.com

Interpretation of packed cells volume

a. PCV layer

An elevated PCV layer occurs in cases of:

- 1- Physiological causes.**
- 2- Hemoconcentration following dehydration.**
- 3- Chronic obstructive pulmonary disease.**
- 4- Pulmonary diseases that associated with hypoxia.**
- 5- Congestive heart failure.**
- 6- Polycythemia**

23

www.scholaridea.com

Lowered PCV layer occurs in cases of:

- Oligocythemia (Erythrocytopenia).**
- Hemodilution.**
- Renal failure, as a result of decreased secretion of erythropoietin.**
- Malignant tumors.**
- Leukemia.**

24

www.scholaridea.com

2. Buffy coat

In blood from normal animal, the buffy coat consists of a white to gray layer 0.5 to 1.2 mm. In size occurring immediately above the PCV layer.

For routine clinical application, a buffy coat of less than 0.5 mm would suggest leucopenia, while above 1.5 mm indicate Leucocytosis

25

www.scholaridea.com

3. Plasma layer

The color of the plasma can help with :

- a) Dark yellow color is an indicator for hemolytic, hepatic and obstructive jaundice.
- b) The pink color of plasma is indicative for hemolysis of erythrocytes, which associate some diseases as bacillary hemoglobinuria and blood parasites as Babesia species .
- c) Milky color of plasma indicates the increase of lipids in blood.

26

www.scholaridea.com

Determination of erythrocytes morphology

27

www.scholaridea.com

Morphological examination of erythrocytes

All parameters of the erythrocyte picture can be determined using a blood cell counter, except assessing the morphology of the RBCs, which must be evaluated using a blood smear. This means, that both electronic blood cell count and blood smear are required to perform the erythrocyte picture.

www.scholaridea.com

Morphological examination of erythrocytes

Morphological examination of erythrocytes is carried out by:

- Examination of a stained blood film (Giemsa stain) under the light microscope and by using the oil immersion lens (X100), the RBCs are examined for shape, size, and stain.
- Calculating and interpreting the mean corpuscular values (indices).

www.scholaridea.com

Evaluating the shape of the RBCs

Evaluation of the Size of the RBCs

Normal RBCs

Macrocytic RBCs

Evaluation of the stain of the RBCS

Mean corpuscular values

1. Mean Corpuscular Volume (MCV)

Mean corpuscular volume (MCV, fl or femtoliter) is a measure of average size of RBC and represents the volume of a single RBC.

This value used to classify red cells as:

- Normocytic red blood cells are of normal size.
- Microcytic red blood cells are smaller than normal.
- Macrocytic red blood cells are larger than normal.

2. Mean Corpuscular Hemoglobin (MCH)

Mean corpuscular hemoglobin (MCH, pg or pictogram) is average weight hemoglobin of erythrocyte in a population of erythrocytes.

3. Mean Corpuscular Hemoglobin concentration (MCHC)

Mean corpuscular hemoglobin concentration (MCHC, g/dl) is the average percent of hemoglobin occupied by the erythrocyte (g/dl)

35

www.scholaridea.com

Mean corpuscular values

1. Mean Corpuscular Volume (MCV)

$$\text{MCV (fl)} = \frac{\text{PCV (\%)} \times 10}{\text{RBC count} \times 10^6/\text{ul}}$$

2. Mean Corpuscular Hemoglobin (MCH)

$$\text{MCH (pg)} = \frac{\text{Hb. g/dl} \times 10}{\text{RBC count} \times 10^6/\text{ul}}$$

3. Mean Corpuscular Hemoglobin concentration (MCHC)

$$\text{MCHC (g/dl)} = \frac{\text{Hb. g/dl} \times 100}{\text{PCV (\%)}}$$

36

www.scholaridea.com

Based on MCH and MCHC red blood cells may be:

- Normochromic red cells with normal Hb concentration.
- Hypochromic red cells with lowered Hb concentration.
- Hyperchromic red cells with elevated Hb concentration.
