

HEMATOLOGY

I- Blood picture

(Complete blood count)

By

Prof. Mahmoud Rushdi
Assiut University
Egypt

1

www.scholaridea.com

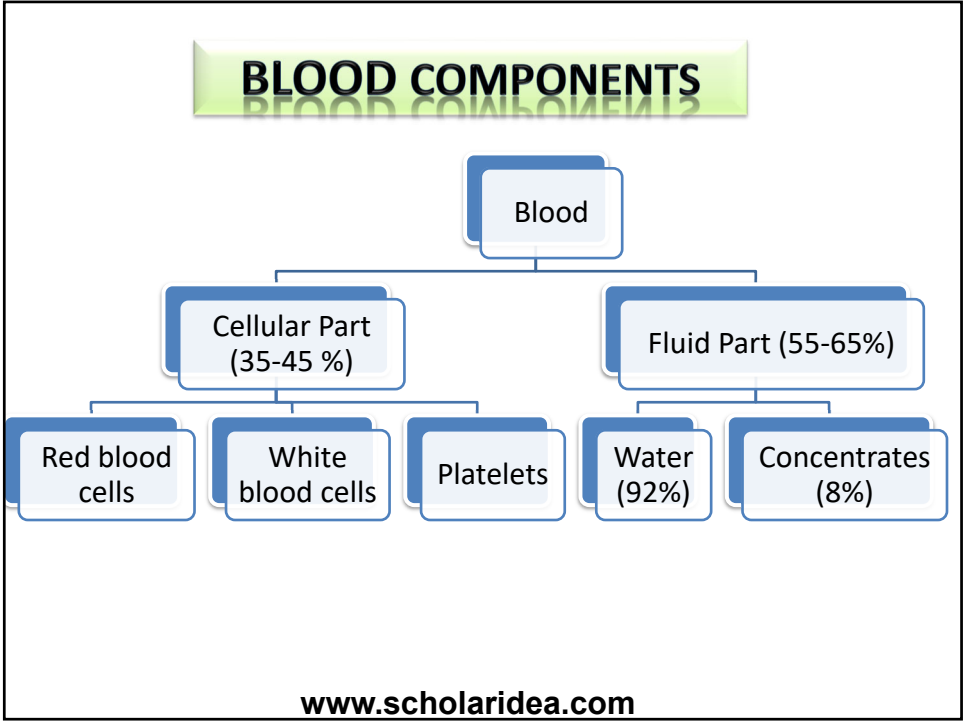

1

Hematology may be defined as the scientific study of the structure and function of the blood in health and disease. Hematology therefore is a laboratory science in which we quantitatively and qualitatively observe the different components of blood in order to diagnose a great variety of diseases.

Types of blood samples

Whole blood

Sample

Blood + Anticoagulant

Serum

Sample

Blood without Anticoagulant

Plasma

Sample

Whole blood

Blood smear

Sample

Whole blood or drop of blood

www.scholaridea.com

8

Anticoagulants

Ethylene Diamine Tetra-acetic acid (EDTA)**Dose: 1mg/ml blood****Mode: Binding ionized calcium****Advantages:**

- ✓ Hematological analysis.
- ✓ No effect on leukocyte staining affinity.
- ✓ Preserve the blood sample for 24 hours.

Disadvantage

- ❖ Higher concentration of salt withdraws water from red cells and reduces PCV values.

www.scholaridea.com

9

Causes of specimen spoilage

Haemolysis**It means the breakdown of the RBCs.**

- Using wet needle or syringe.
- Collection of the blood sample directly to the bottom of the tube.
- Vigorous mixing of the blood sample.
- Excessive negative pressure when collecting sample with a syringe will rupture cells and collapse the vein.
- Failure to remove the needle from the syringe, when transferring blood from a syringe to a container.
- Extreme heat or cold.

www.scholaridea.com

10

Clotting of blood samples

It means formation of clots in the whole blood sample.

- Delay in mixing the blood sample with the anticoagulant.
- The amount of the collected blood sample is larger than the concentration of the anticoagulant.
- Taking long time in collection of the blood sample.

21

Electrical Impedance

- Diluant displacement causes potential difference
- Voltage pulse displayed on an oscilloscope
- No. of impulse = No. of cells
- Height = vol. of cells
- Freq dist curve & size dist histograms
- Requisite – High dilution

22

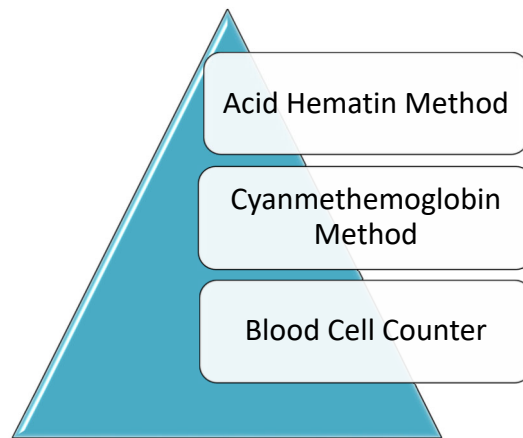

23

3-Part differential	5-part differential	7-part differential
Granulocytes (large cells)	Neutrophils	5 plus
Lymphocytes (small cells)	Eosinophils	Large immature cells (blasts, immature granulocytes) Atypical lymphocytes (including blasts)
Monocytes (mid)	Basophils	
	Lymphocytes	
	Monocytes	
	Large unstained cells (atypical, abnormal cells)	

24

Hemoglobin concentration

25

www.scholaridea.com

25

Hemoglobin concentration

Increase haemoglobin concentration

- ❖ Chronic carbon monoxide poisoning.
- ❖ Polycythemia.
- ❖ Cardiac diseases.
- ❖ Pulmonary diseases.

Decrease hemoglobin concentration

- ❖ Anemia.
- ❖ Amyloid nephrosis.
- ❖ Leukaemia.
- ❖ Malignant tumors.

26

www.scholaridea.com

26

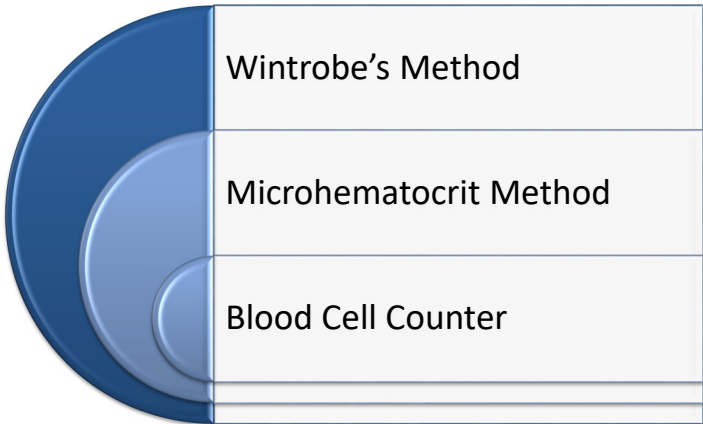

**Hematocrit
Packed cell volume
(PCV)**

Packed cell volume (PCV) or Hematocrit, is defined as the percentage of blood occupied by RBCs, or simply you can define PCV as the percentage of RBCS in whole blood.

www.scholaridea.com

27

Packed cell volume (PCV)

28

www.scholaridea.com

28

29

Packed cell volume (PCV)

Advantages of the microhematocrit method:

- The amount of blood required is considerably less.
- Time required for the entire procedure is less.
- accurate.

Disadvantages of the microhematocrit method

- Special reader is required for reading.
- It is impossible to determine E.S.R. in such small tubes.
- It is difficult to evaluate the depth of the buffy coat.

30

www.scholaridea.com

30

Interpretation of packed cells volume

a. PCV layer

An elevated PCV layer occurs in cases of:

- 1- Physiological causes.**
- 2- Hemoconcentration following dehydration.**
- 3- Chronic obstructive pulmonary disease.**
- 4- Pulmonary diseases that associated with hypoxia.**
- 5- Congestive heart failure.**
- 6- Polycythemia**

31

www.scholaridea.com

31

Lowered PCV layer occurs in cases of:

- Oligocythemia (Erythrocytopenia).**
- Hemodilution.**
- Renal failure, because of decreased secretion of erythropoietin.**
- Malignant tumors.**
- Leukemia.**

32

www.scholaridea.com

32

2. Buffy coat

In blood from normal animal, the buffy coat consists of a white to gray layer 0.5 to 1.2 mm. In size occurring immediately above the PCV layer.

For routine clinical application, a buffy coat of less than 0.5 mm would suggest leucopenia, while above 1.5 mm indicate Leucocytosis

33

www.scholaridea.com

33

3. Plasma layer

The color of the plasma can help with :

- a) Dark yellow color is an indicator for hemolytic, hepatic and obstructive jaundice.
- b) The pink color of plasma is indicative for hemolysis of erythrocytes, which associate some diseases as bacillary hemoglobinuria and blood parasites as Babesia species .
- c) Milky color of plasma indicates the increase of lipids in blood.

34

www.scholaridea.com

34

Determination of erythrocytes morphology

35

www.scholaridea.com

35

Morphological examination of erythrocytes

All parameters of the erythrocyte picture can be determined using a blood cell counter, except assessing the morphology of the RBCs, which must be evaluated using a blood smear. This means, that both electronic blood cell count and blood smear are required to perform the erythrocyte picture.

www.scholaridea.com

36

Morphological examination of erythrocytes

Morphological examination of erythrocytes is carried out by:

- Examination of a stained blood film (Giemsa stain) under the light microscope and by using the oil immersion lens (X100), the RBCs are examined for shape, size, and stain.
- Calculating and interpreting the mean corpuscular values (indices).

www.scholaridea.com

40

41

Mean corpuscular values

Component	Your Value	Standard Range	Units	Flag
White Blood Cell Count	5.4	4.0 - 11.0	K/uL	
Red Blood Cell Count	5.20	4.40 - 6.00	M/uL	
Hemoglobin	16.0	13.5 - 18.0	g/dL	
Hematocrit	47.2	40.0 - 52.0	%	
MCV	91	80 - 100	fL	
MCH	30.8	27.0 - 33.0	pg	
MCHC	33.9	31.0 - 36.0	g/dL	
RDW	12.7	<16.4 -	%	
Platelet Count	149	150 - 400	K/uL	L
Differential Type	Automated			
Neutrophil %	56	49.0 - 74.0	%	
Lymphocyte %	23	26.0 - 46.0	%	L
Monocyte %	13	2.0 - 12.0	%	H
Eosinophil %	7	0.0 - 5.0	%	H
Basophil %	1	0.0 - 2.0	%	
Abs. Neutrophil	3.1	2.0 - 8.0	K/uL	
Abs. Lymphocyte	1.2	1.0 - 5.1	K/uL	
Abs. Monocyte	0.7	0.0 - 0.8	K/uL	
Abs. Eosinophil	0.4	0.0 - 0.5	K/uL	
Abs. Basophil	0.0	0.0 - 0.2	K/uL	

42

Mean corpuscular values

1. Mean Corpuscular Volume (MCV)

Mean corpuscular volume (MCV, fl or femtoliter) is a measure of average size of RBC and represents the volume of a single RBC.

This value used to classify red cells as:

- Normocytic red blood cells are of normal size.
- Microcytic red blood cells are smaller than normal.
- Macrocytic red blood cells are larger than normal.

43

www.scholaridea.com

43

2. Mean Corpuscular Hemoglobin (MCH)

Mean corpuscular hemoglobin (MCH, pg or pictogram) is average weight hemoglobin of erythrocyte in a population of erythrocytes.

3. Mean Corpuscular Hemoglobin concentration (MCHC)

Mean corpuscular hemoglobin concentration (MCHC, g/dl) is the average percent of hemoglobin occupied by the erythrocyte (g/dl)

44

www.scholaridea.com

44

Mean corpuscular values

1. Mean Corpuscular Volume (MCV)

$$\text{MCV (fl)} = \frac{\text{PCV (\%)} \times 10}{\text{RBC count} \times 10^6/\text{ul}}$$

2. Mean Corpuscular Hemoglobin (MCH)

$$\text{MCH (pg)} = \frac{\text{Hb. g/dl} \times 10}{\text{RBC count} \times 10^6/\text{ul}}$$

3. Mean Corpuscular Hemoglobin concentration (MCHC)

$$\text{MCHC (g/dl)} = \frac{\text{Hb. g/dl} \times 100}{\text{PCV (\%)}}$$

45

www.scholaridea.com

45

Based on MCH and MCHC red blood cells may be:

- Normochromic red cells with normal Hb concentration.
- Hypochromic red cells with lowered Hb concentration.
- Hyperchromic red cells with elevated Hb concentration.

46

Platelet Count	H	460	10 ⁹ /L	150 - 450

48

48

Erythrocytes sedimentation rate (ESR)

It is defined as the rate of sedimentation of erythrocytes in a column of anti-coagulated blood at certain time.

A whole blood sample is allowed to stand for a certain time in a perpendicular tube, The erythrocytes are settling down, leaving a clear layer of plasma at the top of the tube. The length of the plasma layer in mm represents a measure of the ESR and expressed as mm/time.

49

www.scholaridea.com

49

Erythrocytes sedimentation rate

Theories of sedimentation:

- **Rouleaux formation theory:**
The red cells of healthy horses has a natural tendency to form chain like arrangement and thus results in rapid settling of red cells.
- **Electrical theory.**
- **Plasma protein theory.**

50

www.scholaridea.com

50

Methods of estimations:

- Wintrobe method.
- Westergreen method.

Anticoagulant

The type of the anticoagulant used for ESR is different according to the method used. EDTA is used for ESR determined by wintrobe method. However, Sodium Citrate (3.8%) is used for ESR that determined using the westergreen method, sodium citrate is used in the ratio of 1:4.

51

www.scholaridea.com

51

Anticoagulants

Sodium citrate

Dose: Sodium citrate 3.8% (1:4 or 1:9)

Mode of action: Binding ionized calcium.

Advantages

- ✓ Blood transfusion.
- ✓ ESR (1:4).
- ✓ Prothrombin time (1:9)
- ✓ Bacteriological culture.

Advantages

- Not suitable for hematological analysis.

www.scholaridea.com

52

Westergreen method

Wintrobe method

www.scholaridea.com

53

Erythrocytes sedimentation rate

Suitable time for ESR:

Equine: 10 minutes and 20 minutes

Cattle: after 24 hrs

Dogs: 1 hour and 2 hour

Sheep: 7hrs and 24hrs

Buffaloes: 1 hour

54

www.scholaridea.com

54

Factors influence the ESR:

1. Physical factors: Temperature, change in size of RBCs and Rouleux formation
2. Chemical factors: Anticoagulant.
3. Physiological factors: Sex, age, pregnancy, exercise altitude and digestion.
4. Technical factors: Position of the tube (Sedimentation is rapid in an inclined position)

55

www.scholaridea.com

55

5. Pathological factors**Accelerated ESR observed in cases of:**

1. All acute generalized infection.
2. Acute localized inflammatory process of serous membranes such as pleura, pericardium and peritoneum.
3. Chronic localized infection.
4. Toxemia.
5. Severe anemia.
6. Malignant neoplasia.
7. At the beginning of abscess formation.
8. Inflammation of draining cavities such as uterus and head sinuses.

www.scholaridea.com

56

Retarded ESR in cases of:

- 1- Hemoconcentration following dehydration.**
- 2- Chronic obstructive pulmonary disease.**
- 3- Pulmonary diseases that associated with hypoxia.**
- 4- Congestive heart failure.**
- 5- Polycythemia.**

DIPHASIC SEDIMENTATION

Occasionally in ESR determination there is no definite line between the settled erythrocytes and the plasma. Reticulocytes and immature erythrocytes exhibit less tendency to form clumps or chains (rouleaux) than mature erythrocytes; thus ESR is retarded or exhibits a diphasic pattern.

DIPHASIC SEDIMENTATION

This phenomenon occurs as a result for the presence of reticulocytes or other young form of erythrocytes which having abnormal shape. This trailing out of erythrocytes occurs because these cells are larger and don't actively participate in rouleux formation.
